# Project Overview

The **Hand Gesture Sign Language Recognition System** bridges the communication gap for individuals who are non-verbal or have speech impairments. It enables them to communicate using **hand gestures**, which are recognized in **real-time** and converted into text. The output can be displayed on-screen, on an IoT-powered LCD, or within a mobile app.

The system supports **Arabic and English alphabets** and **numerical digits**, ensuring inclusivity and accessibility.

---

## Goals

The main goal of this project is to provide a way for people who are unable to speak to **communicate simply and effectively** with people who cannot understand sign language.

---

# 1. Artificial Intelligence (AI) System

## Technologies & Tools

- **Computer Vision:**
  - [MediaPipe](#) – real-time hand landmark detection.
  - [OpenCV](#) – image processing & camera handling.
- **Machine Learning:**
  - **Random Forest Classifier** – trained to recognize gestures (letters and numbers).
  - Data preprocessing with **normalization and augmentation**.

## Why Random Forest?

We selected [Random Forest](#) because:

- It handles **non-linear relationships** well, suitable for complex hand gestures.
- It reduces **overfitting** through ensemble learning.
- It is **fast in training** and **efficient in real-time predictions** compared to deep learning approaches, making it ideal for lightweight hardware integration.

## Code Structure

- **File 1:** Feature extraction with MediaPipe + training a Random Forest model.
- **File 2:** GUI + real-time prediction using the trained model with live camera input.

## Prediction Handling

- Recognizes individual letters, **SPACE**, **DEL**, and **Nothing**.
- Accumulates characters into a sentence with auto-spacing and deletion support.
- Dynamically displays predictions and the evolving sentence.

## Graphical Interface

- Shows a **live video stream** with hand landmark overlays.
- Uses a **neon-bordered canvas** for visual appeal.
- Includes buttons to **Reset** the sentence or **Speak it aloud**.

## Text-to-Speech (TTS)

- Uses [pyttsx3](#) and [gTTS](#) libraries to convert recognized letters or sentences into speech.
- Users can press the **Speak button** to hear the translated output.

## Keyboard Shortcuts (GUI Version)

- **Spacebar** → Add space
- **Backspace** → Delete character
- **Enter** → Speak sentence
- **Escape** → Exit application

## Dataset

- Open-source sign language datasets.
- Custom images from webcam & mobile camera.
- Coverage:
  - **A–Z (English)**
  - **Arabic alphabet**
  - **0–9 (Numbers)**

## Features

- Real-time recognition with camera.
- **Bilingual support** (Arabic + English).
- **text-to-speech**: after detecting a gesture and translating it into a letter, the user can hear the letter pronounced.

---

## 2. Internet of Things (IoT) System

### Components

- [LCD Display](#) – to show recognized letters.
- [ESP8266 Module](#) – acts as an integration hub, receiving results from Python and sending them to Arduino.
- [Arduino UNO](#) – controls the LCD display.

### Special Considerations

- The LCD does not natively support **Arabic letters**.
- To overcome this, Arabic characters were manually written in code **bit by bit** for correct display.

### How It Works

1. Recognized gesture output is sent from the AI system via **Python** → **ESP8266** → **Arduino**.
2. Arduino drives the **LCD** to display the recognized character.
3. The system provides immediate **hardware feedback** alongside software output.

---

## 3. Mobile Application

### Platform & Tools

- Built using [MIT App Inventor](#) for rapid development.

### Features

- Uses a camera to detect hand gestures.
  - Translates gestures into **letters in real-time**.
  - Integrated with the AI system: recognized letters are sent directly to the mobile app.
  - Allows **on-the-go communication** for non-verbal users.
-

## 4. Future Updates

- **Gesture-to-words translation:** extend beyond letters/digits to recognize complete words.
- **Expanded dataset** for more natural communication.
- Cloud syncing for **data storage and monitoring**.
